**Download**

download So, I tried to apply the patch for the fix mentioned, but it shows an error. A: You can use the built in process of windows to install a new program. Or if your laptop is windows 8, you can download a program called easy peasy and use it. It makes it easier than the built in method. download code pinnacle download epidermal Put the two exe files into your documents/application folder. Right click on epidermal and click 'run as administrator' After the wizard finishes you will have the 'livescribe.epidermal.config' file in your documents/application folder. Open up the livescribe.epidermal.config file and create the same keys you did when you first installed the program (I used the same email and password) and the you're good to go. It's not the easiest process, but it's a lot easier than trying to handcraft the settings for your software. Q: How can I get the pixel difference between two images using numpy? I have an image with two important attributes. The first is a mask and the

---

second is a numerical value of each element in the mask. I want to get the difference between the mask of the first image and the mask of the second image, and then set the non-zero values to 1 and the zero values to 0. The only method I can think of to do this is using np.where: `import numpy as np mask = np.zeros(shape=(200,200)) mask = np.random.randint(0,10,(200,200)) value1 = np.ones(shape=(200,200)) value2 = np.ones(shape=(200,200)) # Get the difference of two masks for x in range(200): for y in range(200): if mask[x,y]!= 0: value1[x,y] -= mask[x,y]` 82157476af
